# Introduction to Kubernetes

# Introduction to Kubernetes

---

- ★ Kubernetes is an open-source container orchestration software
- ★ It was originally developed by Google
- ★ It was first released on July 21<sup>st</sup> 2015
- ★ It is the ninth most active repository on GitHub in terms of number of commits

# Features of Kubernetes

---

- ★ Pods
- ★ Replication Controller
- ★ Storage Management
- ★ Resource Monitoring
- ★ Health Checks
- ★ Service Discovery
- ★ Networking
- ★ Secret Management
- ★ Rolling Updates

# Docker Swarm vs Kubernetes

# Docker Swarm vs Kubernetes

Source: trends.google.com

# Docker Swarm vs Kubernetes

---

## Docker Swarm

- ★ Easy to Install and Initialize
- ★ Faster when compared to Kubernetes
- ★ Not Reliable and has less features

## Kubernetes

- ★ Complex Procedure to install Kubernetes
- ★ Slower when compared with Docker Swarm
- ★ More Reliable and comparatively has more features

# Kubernetes Architecture

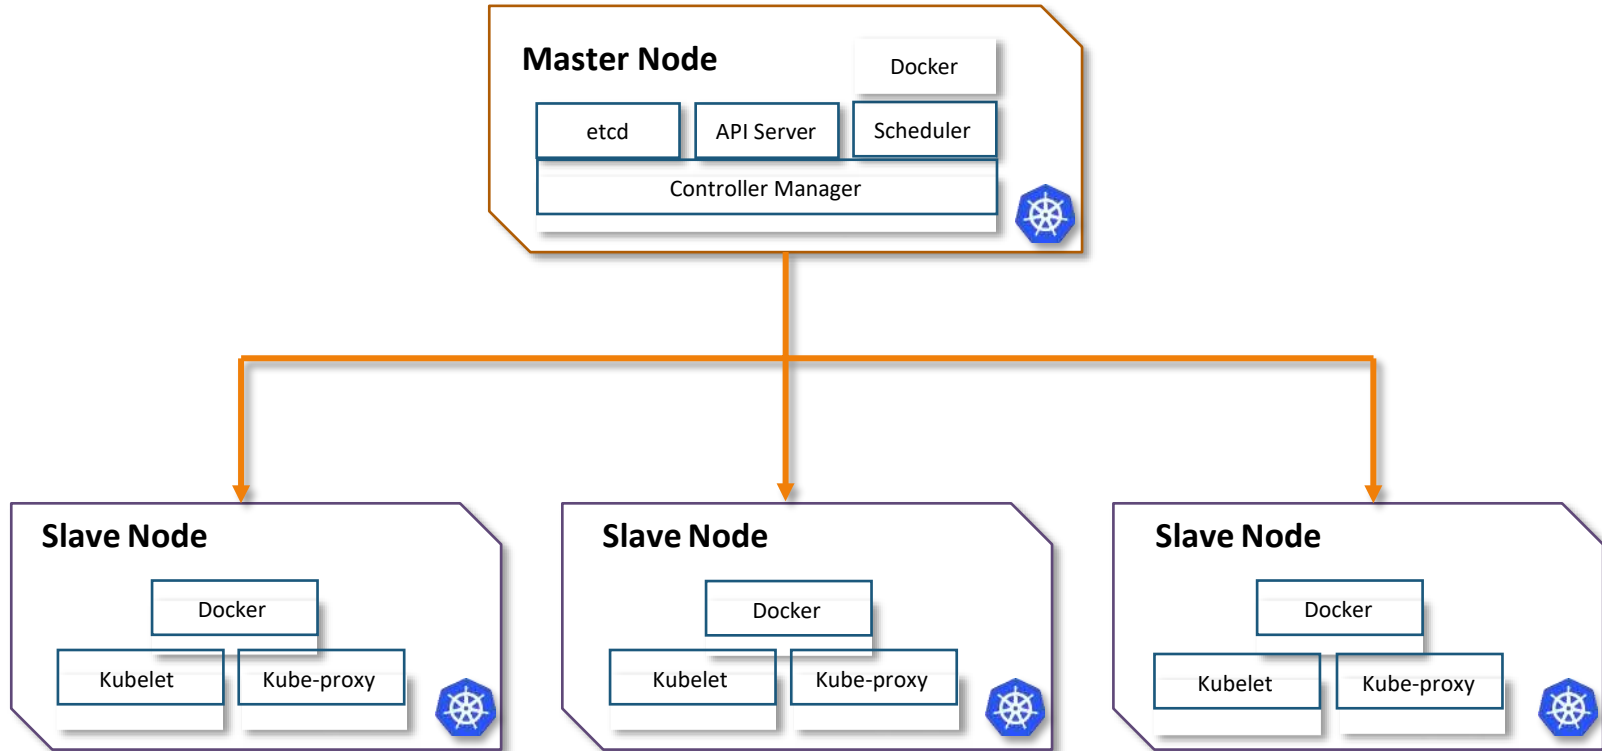

# Kubernetes Architecture

---

# Kubernetes Architecture

---

# Kubernetes Architecture – Master Components

# Kubernetes Architecture – Master Components

etcd

API Server

Scheduler

Controller Manager

It is a highly available distributed key value store, which is used to store cluster wide secrets. It is only accessible by Kubernetes API server, as it has sensitive information.

## Master Node

etcd

API Server

Docker

Scheduler

Controller Manager

# Kubernetes Architecture – Master Components

etcd

**API Server**

Scheduler

Controller Manager

It exposes the Kubernetes API. The Kubernetes API is the front-end for Kubernetes Control Plane, and is used to deploy and execute all operations in Kubernetes

## Master Node

etcd

**API Server**

Docker

Scheduler

Controller Manager

# Kubernetes Architecture – Master Components

etcd

API Server

**Scheduler**

Controller Manager

The scheduler takes care of scheduling of all the processes, Dynamic Resource Management and manages present and future events on the cluster

## Master Node

etcd

API Server

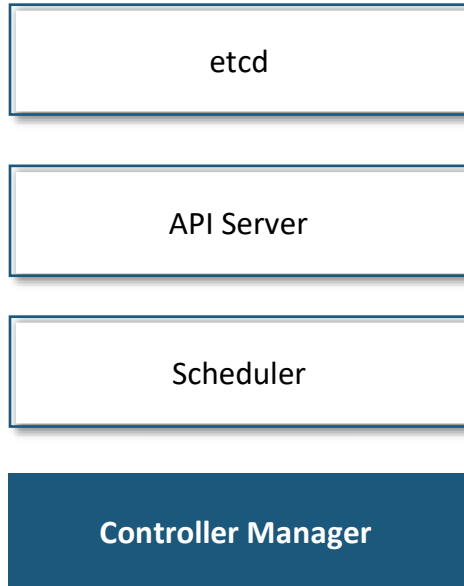

Docker

**Scheduler**

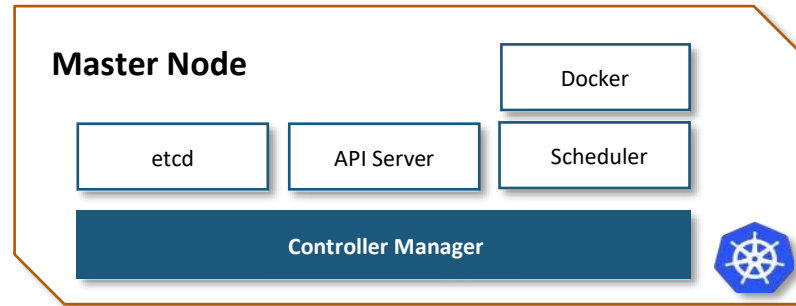

Controller Manager

# Kubernetes Architecture – Master Components

The controller manager, runs all the controllers on the Kubernetes Cluster. Although each controller, is a separate process, but to reduce complexity, all the controllers are compiled into a single process. They are as follows:  
**Node Controller, Replication Controller, Endpoints Controller, Service Accounts and Token Controllers**

# Kubernetes Architecture – Slave Components

# Kubernetes Architecture – Master Components

Kubelet

Kube-Proxy

Kubelet takes the specification from the API server, and ensures the application is running according to the specifications which were mentioned.  
Each node has it's kubelet service

## Slave Node

Docker

Kubelet

Kube-proxy

# Kubernetes Architecture – Master Components

Kubelet

Kube-Proxy

This proxy service runs on each node and helps in making services available to the external host. It helps in connection forwarding to the correct resources, it is also capable of doing primitive load balancing

## Slave Node

Docker

Kubelet

Kube-proxy

# Kubernetes Installation

# Kubernetes Installation

---

There are numerous ways to install Kubernetes, following are some of the popular ways:

- **Kubeadm** – Bare Metal Installation
- **Minikube** – Virtualized Environment for Kubernetes
- **Kops** – Kubernetes on AWS
- **Kubernetes on GCP** – Kubernetes running on Google Cloud Platform

# Hands-on: Installing Kubernetes using kubeadm

# Working of Kubernetes

# Working of Kubernetes

---

**Pods** can have one or more containers coupled together. They are the basic unit of Kubernetes. To increase High Availability, we always prefer pods to be in replicas

Pod – Replica 1

Pod – Replica 2

Pod – Replica 3

# Working of Kubernetes

---

**Services** are used to load balance the traffic among the pods. It follows round robin distribution among the healthy pods

Pod - Replica 1

Pod - Replica 2

Pod - Replica 3

# Working of Kubernetes

# Deployments in Kubernetes

# Deployments in Kubernetes

---

Deployment in Kubernetes is a controller which helps your applications reach the desired state, the desired state is defined inside the deployment file

**Deployment**

# YAML Syntax for Deployments

---

This YAML file will deploy 3 pods for nginx, and maintain the desired state which is 3 pods, until this deployment is deleted

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: nginx-deployment
  labels:
    app: nginx
spec:
  replicas: 3
  selector:
    matchLabels:
      app: nginx
  template:
    metadata:
      labels:
        app: nginx
    spec:
      containers:
        - name: nginx
          image: nginx:1.7.9
          ports:
            - containerPort: 80
```

# Creating a Deployment

---

Once the file is created, to deploy this deployment use the following syntax:

Syntax

```
kubectl create -f nginx.yaml
```

 ubuntu@ip-172-31-39-244: ~

```
ubuntu@ip-172-31-39-244:~$ kubectl create -f nginx.yaml  
deployment.apps/nginx-deployment created  
ubuntu@ip-172-31-39-244:~$ █
```

# List the Pods

---

To view the pods, type the following command:

Syntax

```
kubectl get po
```

```
ubuntu@ip-172-31-39-244: ~  
ubuntu@ip-172-31-39-244:~$ kubectl get po  
NAME                                READY   STATUS    RESTARTS   AGE  
nginx-deployment-76bf4969df-24vp1   1/1     Running   0           4m38s  
nginx-deployment-76bf4969df-frz7j   1/1     Running   0           4m38s  
nginx-deployment-76bf4969df-grnmc   1/1     Running   0           4m38s  
ubuntu@ip-172-31-39-244:~$
```

As you can see, the number of pods are matching with the number of replicas specified in the deployment file

# Creating a Service

# Creating a Service

---

A Service is basically a round-robin load balancer for all the pods, which match with its name or selector. It constantly monitors the pods, in case a pod gets unhealthy, the service will start deploying the traffic to the other healthy pods.

# Service Types

---

**ClusterIP:** Exposes the service on cluster-internal IP

**NodePort:** Exposes the service on each Node's IP at a static port

**LoadBalancer:** Exposes the service externally using a cloud provider's load balancer.

**ExternalName:** Maps the service to the contents of the ExternalName

# Creating a NodePort Service

---

We can create a NodePort service using the following syntax:

## Syntax

```
kubectl create service nodeport <name-of-service> --tcp=<port-of-service>:<port-of-container>
```

 ubuntu@ip-172-31-39-244: ~

```
ubuntu@ip-172-31-39-244:~$ kubectl create service nodeport nginx --tcp=80:80
service/nginx created
ubuntu@ip-172-31-39-244:~$ █
```

# Creating a NodePort Service

---

To know the port, on which the service is being exposed type the following command:

Syntax

```
kubectl get svc nginx
```

ubuntu@ip-172-31-39-244: ~

```
ubuntu@ip-172-31-39-244:~$ kubectl get svc nginx
```

NAME	TYPE	CLUSTER-IP	EXTERNAL-IP	PORT(S)	AGE
nginx	NodePort	10.103.235.81	<none>	80:32043/TCP	114s

```
ubuntu@ip-172-31-39-244:~$
```

# Creating a NodePort Service

---

To know the port, on which the service is being exposed type the following command:

Syntax

```
kubectl get svc nginx
```

ubuntu@ip-172-31-39-244: ~

```
ubuntu@ip-172-31-39-244:~$ kubectl get svc nginx
```

NAME	TYPE	CLUSTER-IP	EXTERNAL-IP	PORT(S)	AGE
nginx	NodePort	10.103.235.81	<none>	80:32043/TCP	114s

```
ubuntu@ip-172-31-39-244:~$
```

# Creating an Ingress

# What is an Ingress?

---

**Kubernetes ingress** is a collection of routing rules that govern how external users access services running in a Kubernetes cluster.

# What is an Ingress?

# Installing Ingress Controller

---

We will be using the nginx ingress controller, for our demo. We can download it from the following link:

Link

<https://github.com/kubernetes/ingress-nginx/blob/master/docs/deploy/index.md>

The NGINX logo is displayed in a large, bold, green font. The letters are stylized, with the 'G' and 'i' having unique shapes. The 'X' is composed of two intersecting lines.

# Define Ingress Rules

---

The following rule, will redirect traffic which asks for /foo to nginx service. All the other requests, will be redirected to ingress controller's default page

```
apiVersion: extensions/v1beta1
kind: Ingress
metadata:
  name: simple-fanout-example
  annotations:
    nginx.ingress.kubernetes.io/rewrite-target: /
spec:
  rules:
  - http:
      paths:
      - path: /foo
        backend:
          serviceName: nginx
          servicePort: 80
```

# Deploying Ingress Rules

---

To deploy the ingress rules, we use the following syntax:

Syntax

```
kubectl create -f ingress.yaml
```

ubuntu@ip-172-31-17-194: ~

```
ubuntu@ip-172-31-17-194:~$ kubectl create -f ingress.yaml
ingress.extensions/simple-fanout-example created
ubuntu@ip-172-31-17-194:~$
```

# Viewing Ingress Rules

---

To deploy the ingress rules, we use the following syntax:

Syntax

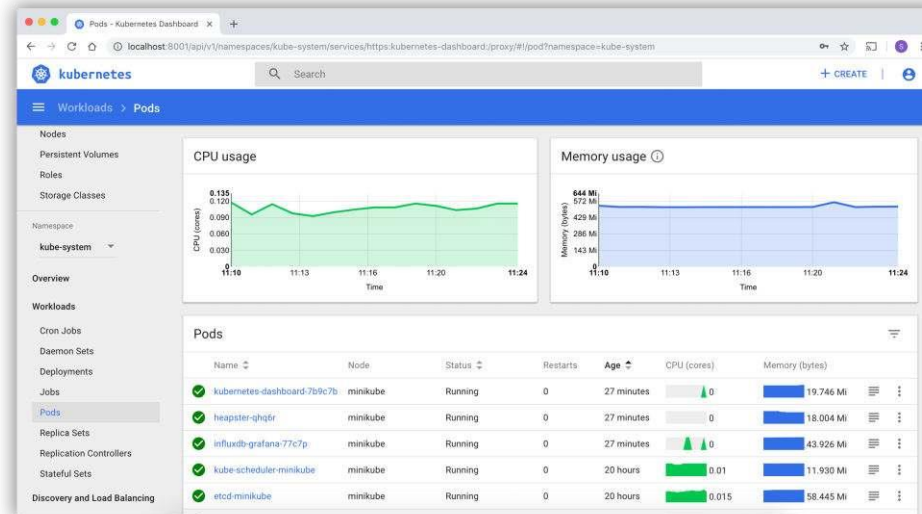

```
kubectl get ing
```

```
ubuntu@ip-172-31-17-194: ~  
ubuntu@ip-172-31-17-194:~$ kubectl get ing  
NAME                HOSTS    ADDRESS    PORTS    AGE  
simple-fanout-example *        80         2m5s  
ubuntu@ip-172-31-17-194:~$
```

# Kubernetes Dashboard

# Kubernetes Dashboard

Dashboard is a web-based Kubernetes user interface. You can use Dashboard to deploy containerized applications to a Kubernetes cluster, troubleshoot your containerized application, and manage the cluster resources.

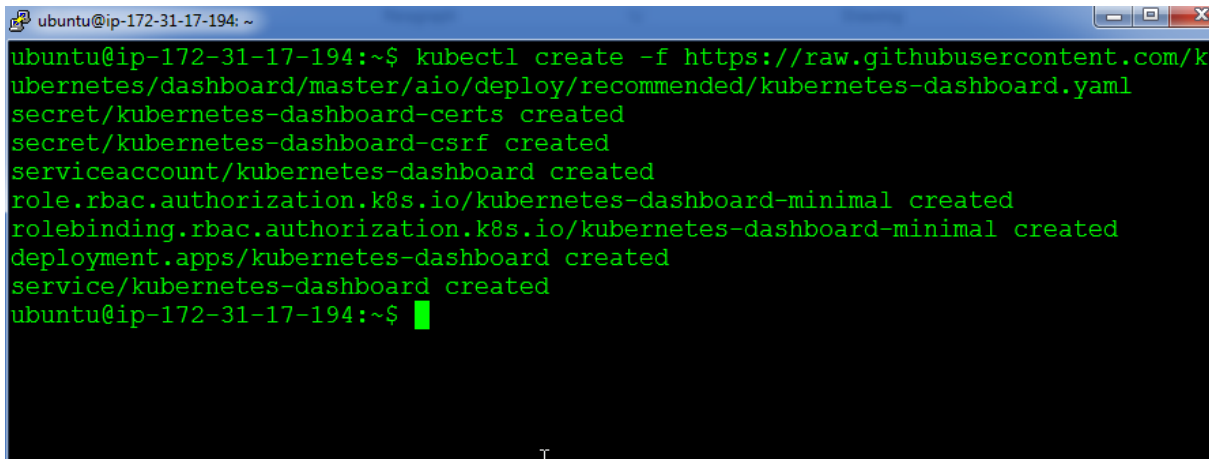

# Installing Kubernetes Dashboard

---

To install Kubernetes Dashboard, execute the following command:

## Syntax

```
kubectl create -f  
https://raw.githubusercontent.com/kubernetes/dashboard/master/aio/deploy/recommended/kubernetes-  
dashboard.yaml
```

```
ubuntu@ip-172-31-17-194: ~  
ubuntu@ip-172-31-17-194:~$ kubectl create -f https://raw.githubusercontent.com/kubernetes/dashboard/master/aio/deploy/recommended/kubernetes-  
dashboard.yaml  
secret/kubernetes-dashboard-certs created  
secret/kubernetes-dashboard-csrf created  
serviceaccount/kubernetes-dashboard created  
role.rbac.authorization.k8s.io/kubernetes-dashboard-minimal created  
rolebinding.rbac.authorization.k8s.io/kubernetes-dashboard-minimal created  
deployment.apps/kubernetes-dashboard created  
service/kubernetes-dashboard created  
ubuntu@ip-172-31-17-194:~$ █
```

# Accessing Kubernetes Dashboard

Change the service type for Kubernetes-Dashboard to Nodeport

Syntax

```
kubectl -n kube-system edit service/kubernetes-dashboard
```

```
ubuntu@ip-172-31-17-194: ~  
[!] Please edit the object below. Lines beginning with a '#' will be ignored,  
# and an empty file will abort the edit. If an error occurs while saving,  
# it will be reopened with the relevant failures.  
#  
apiVersion: v1

```

# Logging into Kubernetes Dashboard

---

1. Check the NodePort from the kubernetes-dashboard service
2. Browse to your cluster on the internet browser, and enter the IP address
3. Click on Token, it will ask you for the token entry
4. Generate a token using the following command

```
$ kubectl create serviceaccount cluster-admin-dashboard-sa
$ kubectl create clusterrolebinding cluster-admin-dashboard-sa \
  --clusterrole=cluster-admin \
  --serviceaccount=default:cluster-admin-dashboard-sa

$ TOKEN=$(kubectl describe secret $(kubectl -n kube-system get secret | awk '/^cluster-admin-dashboard-sa-token-/{print $1}') | awk '$1=="token:"{print $2}')

$ echo $TOKEN
```

5. Finally, enter the token and login to your dashboard
